Section 1 : Coding

1. Problem Statement

Riya owns a store and keeps track of item prices from two different suppliers using two separate dictionaries. He wants to compare these prices to identify any differences. Your task is to write a program that calculates the absolute difference in prices for items that are present in both dictionaries. For items that are unique to one dictionary (i.e., not present in the other), include them in the output dictionary with their original prices.

Help Riya to implement the above task using a dictionary.

Input Format

The first line of input consists of an integer n1, representing the number of items in the first dictionary.

The next n1 lines contain two integers

1. The first line contains the item (key), and
2. The second line contains the price (value).

The following line consists of an integer n2, representing the number of items in the second dictionary

The next n2 lines contain two integers

1. The first line contains the item (key), and
2. The second line contains the price (value).

Output Format

The output should display a dictionary that includes:

1. For items common to both dictionaries, the absolute difference between their prices.
2. For items that are unique to one dictionary, the original price from that dictionary.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1
4
4
1
8
7
Output: {4: 4, 8: 7}

Answer

```
n=int(input())
d1={}
d2={}
d3={}
used=[]
```

```
for i in range(n):
  a=int(input())
  b=int(input())
  d1[a]=b
n=int(input())
for i in range(n):
  a=int(input())
  b=int(input())
  d2[a]=b
for i in d1:
  if  i in d2:
    d3[i]=abs(d1[i]-d2[i])
  else:
    d3[i]=d1[i]
  used.append(i)
for i in d2:
  if i not in used:
    d3[i]=d2[i]
print(d3)
```

Status : Correct   *Marks : 10/10*

2. Problem Statement

Riley is analyzing DNA sequences and needs to determine which bases
match at the same positions in two given DNA sequences. Each DNA
sequence is represented as a tuple of integers, where each integer
corresponds to a DNA base.

Your task is to write a program that compares these two sequences and
identifies the bases that match at the same positions and print it.

Input Format

The first line of input consists of an integer n, representing the size of the first
tuple.

The second line contains n space-separated integers, representing the elements
of the first DNA sequence tuple.

The third line of input consists of an integer m, representing the size of the

second tuple.

The fourth line contains m space-separated integers, representing the elements of the second DNA sequence tuple.

Output Format

The output is a space-separated integer of the matching bases at the same positions in both sequences.

Refer to the sample output for format specifications.

Sample Test Case

Input: 4
5 1 8 4
4
4 1 8 2
Output: 1 8

Answer

```
n=int(input())
l1=list(map(int,input().split()))
n=int(input())
l2=list(map(int,input().split()))
for i in range(min(len(l1),len(l2))):
    if l1[i]==l2[i]:
        print(l1[i],end=' ')
```

Status : Correct   *Marks : 10/10*

3. Problem Statement

James is an engineer working on designing a new rocket propulsion system. He needs to solve a quadratic equation to determine the optimal launch trajectory. The equation is of the form $ax^2 + bx + c = 0$.

Your task is to help James find the roots of this quadratic equation.

Depending on the discriminant, the roots might be real and distinct, real and equal, or complex. Implement a program to determine and display the roots of the equation based on the given coefficients.

Input Format

The first line of input consists of an integer N, representing the number of coefficients.

The second line contains three space-separated integers a,b, and c representing the coefficients of the quadratic equation.

Output Format

The output displays:

1. If the discriminant is positive, display the two real roots.
2. If the discriminant is zero, display the repeated real root.
3. If the discriminant is negative, display the complex roots as a tuple with real and imaginary parts.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 3
1 5 6
Output: (-2.0, -3.0)

Answer

```
n = int(input().strip())
lis = tuple(map(int, input().split()))
a, b, c = lis
disc = b * b - 4 * a * c
if disc > 0:
    sqrt_disc = disc ** 0.5
    root1 = (-b + sqrt_disc) / (2 * a)
    root2 = (-b - sqrt_disc) / (2 * a)
    roots = (root1, root2)
elif disc == 0:
    root = -b / (2 * a)
```

```
    roots = (root, root)
else:
    temp = -disc
    sqrt_temp = temp ** 0.5
    real = -b / (2 * a)
    imag = sqrt_temp / (2 * a)
    roots = ((real, imag), (real, -imag))
print(roots)
```

Status : Correct   *Marks : 10/10*

4. Problem Statement

Alex is working with grayscale pixel intensities from an old photo that has been scanned in a single row. To detect edges in the image, Alex needs to calculate the differences between each pair of consecutive pixel intensities.

Your task is to write a program that performs this calculation and returns the result as a tuple of differences.

Input Format

The first line of input contains an integer n, representing the number of pixel intensities.

The second line contains n space-separated integers representing the pixel intensities.

Output Format

The output displays a tuple containing the absolute differences between consecutive pixel intensities.

Refer to the sample output for format specifications.

Sample Test Case

Input: 5
200 100 20 80 10

Output: (100, 80, 60, 70)

Answer

```
n=int(input())
l=list(map(int,input().split()))
l1=[]
for i in range(0,n-1):
    l1.append(abs(l[i]-l[i+1]))
print(tuple(l1))
```

Status : Correct   *Marks : 10/10*
